

Earned Path Training Program Description

Objective

Earned Path combines the need for trained workers in growing “green” industry occupations with the career desires of people in the United States of America and elsewhere who are underprivileged.

Qualifying Criteria

Qualifying criteria for Earned Path careers are defined by employers, groups and associations in concert with emerging funding through local, state, federal and international economic development programs.

Program

Earned Path establishes custom-training programs designed to increase efficiency and energy independence for stakeholders using program management controls that measure scheduling and project development efforts. Earned Path training programs schedule teams focused on splitting apart priorities for people within a given development network.

Scheduled activities are framed around cost centers using performance indicators and other measurable instruments. Logic-based path analysis associates budgeted deliverables using Critical Path Method (CPM) to minimize overlap and optimize work packages.

Parent tasks associated with work packages define a training program. Program Evaluation and Review Technique (PERT) helps document milestones according to the percentage of completed work. PERT charting shows the logical relationship of activities including subtasks.

A Work Breakdown Structure (WBS) with work shift variables provides data needed for planning and diagramming.

Conclusion

Balancing human resources against training objectives in today’s distributed work environments requires a new approach. Earned Path envisions a transparent media with audit capabilities and rapid remediation of program deficiencies. This will help establish respect, truth, and trust for tomorrow’s learning systems.
